WEATHER

WEATHER SYNOPSIS BY REGION:

Northern Region

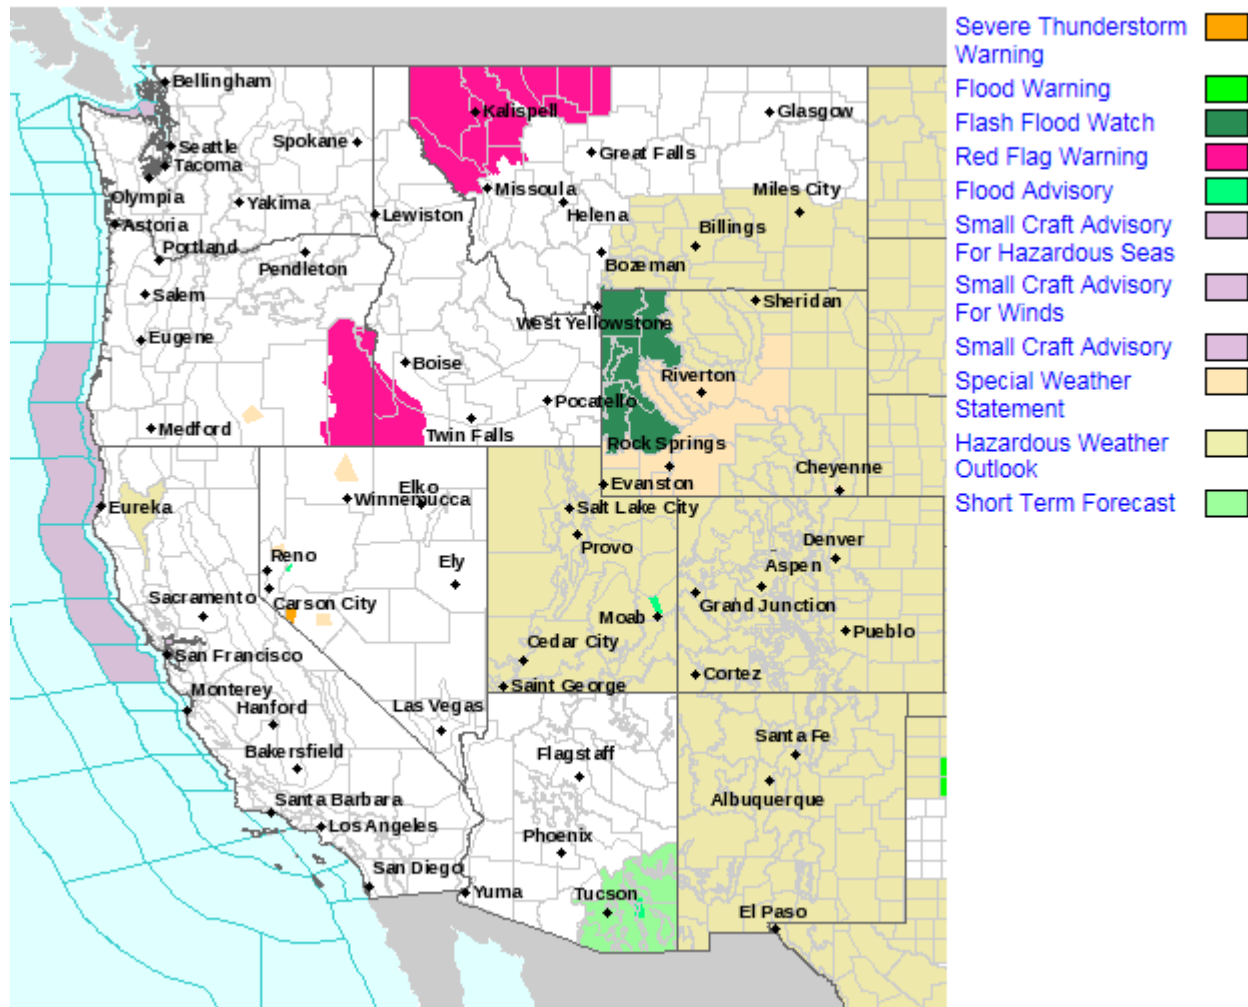

A low pressure trough lies on a line from Northeast British Columbia to just off our Northern California Coast this morning. This puts a southwest flow aloft over most of the Northern Operational Area, which has a tendency to gradually push the humid and generally unstable air mass from the past two days east toward the Great Basin. There were over 4,100 Northern Operational Area lightning strikes Tuesday, coming in moderately wet to very wet cells. The forecast shows one more day with isolated showers and wet thunderstorms over the area, with most of the action confined near the Cascade/Sierra Crest and eastward. Rain totals in affected areas are expected to be less than the locally heavy amounts of Tuesday. Thursday now looks dry and stable enough to put any thunderstorm chance fewer than five percent and staying in the far Eastside Predictive Service Area. Friday through Monday should be a drier, warmer period, with Lightning Activity Level of one, as high pressure aloft gets a little stronger. A second trough passing west to east across the Pacific Northwest will keep southwest to west-northwest winds aloft. High pressure gets considerably stronger from next Tuesday to Thursday, bringing strong warming of 4-12 degrees above normal inland temperatures, and some single-digit minimum relative humidity in the driest valleys. Winds will become lighter and more variable in that time frame, mainly local diurnal type breezes. It remains to be seen if another monsoonal/subtropical moisture surge might ride the flank of the high toward Northern California by late next week or next weekend.

Southern Region

Due to lingering subtropical moisture, scattered showers and wet thunderstorms will occur in the Sierra once again this afternoon. Yesterday there were over 1,000 lightning discharges, but expect less than half as much today. Winds aloft may allow a few of these storms to develop across the Ventura County portion of the Los Padres National Forest and the Kern County Mountains as well. Temperatures will remain in the 80s across the coast, lower 90s in the valleys, and up to 105 degrees in the deserts. Clearing will be slow across the coastal areas. Minimum relative humidity will still remain very high with most places outside the desert remaining well above 25%. Thursday, southwesterly flow will push the moisture east of the area and only some cumulus buildups along the Sierra Crest are expected. No thunderstorms are expected Thursday through the weekend. Drier air will begin to work into the area, and by the weekend, expect minimum relative humidity to drop back into the teens above and inland from the marine layer. Onshore flow is expected to strengthen which will lead to breezy conditions in and near the deserts during the afternoon. Temperatures will hold steady through Saturday, then slightly warmer weather may return to the area. Another surge of moisture may lead to scattered afternoon convection in the desert by next Tuesday or Wednesday.
